balcony flooring systems

Balcony flooring made easy

Thanks to the low weight of the panels, installation is very straightforward. The aluminium profiles are easy to handle and install by hand. Plus, they can be drilled, milled or cut using standard wood and aluminium tools.

For planners: balkoFLOOR 333 aluminium panel type-tested by the LGA.

Stable and sealed

Our sound-insulated click system with its uniform joint pattern means that the aluminum profiles are completely sealed and dimensionally stable. As a result, they protect against dripping water and require far less support structure than conventional flooring panels. Thanks to the structurally calculated multi-chamber system, a support span of up to 1.76 m is completely sufficient. The lower number of supports required means that the cost of the balcony frame are significantly lower.

Elegant, durable and versatile

The surface of the panels can be made in different colours and decors. The underside is white powder coated and therefore bright, friendly and easy to clean.

Aluminium is extremely durable – under normal circumstances it won't rot, rust, decay, or break up due to weather conditions.

balkoFLOOR is suitable for all terraces, pergolas and loggias, as well as for all balconies such as prefabricated balconies made of steel, aluminum, wood or concrete. In addition, all kinds of renovation can be made very successfully.

Technically impeccable

balkoFLOOR panels are manufactured according to the applicable DIN standards and therefore delivered with the CE mark. Thanks to the proven click system, the panels can be laid almost without joints. The additional built-in seal ensures impermeability on the one hand and a sound-deadened connection on the other.
